b1-2 is a1), to one of the terminals of a main chain of a polymer having a repeating unit of formula I (wherein V0 is -COO- and the like, D0 is a 8-22C hydrocarbon group and a1-2 is H and the like), (for example, a compound of formula III), and a dispersion-stabilizing resin, which has a repeating unit of formula IV (wherein X1 is -COO- and the like, Y1 is a 10-32C aliphatic group and d1-2 is a1) and has a partially cross-linked main chain, is subjected to polymerization, thereby producing resin particles. The resultant resin particles are disposed in a non-aqueous solvent having a specific electric resistance and permittivity (for example, Isopar G).

ABSTRACT:

PROBLEM TO BE SOLVED: To obtain an oil-base ink having re-dispersibility, storage stability and plate wear by dispersing resin particles obtained by polymerizing a monofunctional monomer and a limited substituent-containing monomer in the presence of a soluble dispersion- stabilizing resin the polymer chain of which is partially crosslinked in a nonaqueous medium having specified electrical properties.

SOLUTION: The plate printing plate is prepared by forming a

SOLUTION: The plate printing plate is prepared by forming a plate having an image receiving layer containing zinc oxide and a binder resin and having a contact angle of 50° or above with planographic water on a water-resistant support and forming an image on the layer by an ink jet system by using an ink containing dispersible resin particles in a nonaqueous carrier fluid having an electrical resistance of 10⁹Ω or above and a permittivity of 3.5 or below. The dispersed resin particles are obtained by polymerizing a monofunctional monomer with a solution containing a substituent- containing monomer of formula I (wherein E1 is an aliphatic group or the like; U1 is formula III or the like; and a1 and a2 are each hydrogen or the like) and a partially crosslinked soluble dispersion stabilizing resin having repeating units of formula II (wherein X1 is formula IV or the like; Y1 is an aliphatic group; and b1 and b2 are each hydrogen or the like).

ABSTRACT:

PROBLEM TO BE SOLVED: To obtain an oil-base ink having a good printability by using non- water-dispersed resin particles obtained by polymerizing a monofunctional monomer in the presence of a dispersion-stabilizing resin which is a comb copolymer comprising a macromonomer being a soluble part and a monofunctional monomer being an insoluble part and colloiddally

monofunctional monomer being an insoluble part and colloiddally dispersed in a nonaqueous medium having specified electrical properties.

SOLUTION: The plate printing plate is prepared by forming a plate having an image receiving layer containing zinc oxide and a binder resin and having a contact angle of 50° or above with planographic water on a water-resistant support and forming an image on the layer by an ink jet system by using an ink containing dispersible resin particles in a nonaqueous carrier fluid having an electrical resistance of $10^9\Omega$; or above and a permittivity of 3.5 or below. The dispersible resin particles are obtained by polymerizing a monofunctional monomer in the presence of colloidal copolymer comprising a main component of formula I (wherein X0 is formula II or phenylene; R" is hydrogen or the like; Q' is an alkyl or the like; and a1 and a2 are each H, a halogen or the like), a macromonomer terminated with formula III (wherein R1=X0; and b1 and b2 are each the same as a1 or a2) and a monofunctional monomer.

C09D 155/00; C08F 290/06

ABSTRACT:

PROBLEM TO BE SOLVED: To achieve excellent re-dispersibility, storage stability and durability to repeated in printing, by forming copolymer resin particles through polymerizing a monofunctional monomer to a dispersion-stabilizing resin, which is dispersed in a colloidal form in a non-aqueous solution containing a macromonomer of a specific weigh average molecular weight having a polymerizable double bond group only at one terminal of the main chain and the monofunctional monomer.

SOLUTION: The dispersion-stabilizing resin, which contains a macromer of a weight average molecular weight of 1×10^3 to 2×10^4 containing a component represented by formula I (wherein X0 is -COO-, -CO- and the like, Q1 is a 10-32C alkyl and a1 and a2 are H, a halogen and the like), as a main component, and having a polymerizable double bond group represented by formula II, (wherein X1=X0 and b1, b2=a1, a2), only at one terminal of the main chain thereof; and a monofunctional monomer, which becomes insoluble in a non-aqueous solvent when it is polymerized is prepared. The monofunctional monomer is polymerized to obtain resin particles dispersed in a non-aqueous carrier liquid having an electric resistance of $10^9 \Omega \cdot \text{cm}$ or more and a permittivity of 3.5 or less.

ABSTRACT:

PROBLEM TO BE SOLVED: To provide an oil-base ink compsn. for ink jet that is excellent in storage stability and in reproducibility of images in repeated continuous form plate production.

SOLUTION: This compsn. is prepd. by dispersing hydrophobic resin particles solid at least at normal temp. in a nonaq. solvent having an electric resistace of $10^9\Omega\cdot\text{cm}$ or higher and a permittivity of 3.5 or lower and by incorporating at least one 12C or higher branched aliph. alcohol in an amt. of 0.1-40 pts.wt. (based on 1 pt.wt. resin particles) into the same. The resin particles are pref. positive or negative electroscopic particles.

INT-CL (IPC): C09D 11/00; B41M 5/00; C09D 155/00; C08F 290/06

ABSTRACT:

PROBLEM TO BE SOLVED: To improve the redispersibility, storage stability and durability to repeated printing, by dispersing, in a non-aqueous carrier liquid, resin particles of a copolymer prepared by polymerizing a monofunctional monomer in the presence of a dispersion-stabilizing resin, which is obtained using a macromonomer having a polymerizable double bond group at a terminal thereof as a comonomer component and which has a structure containing a repeating unit in the main chain and/or a comb thereof.

SOLUTION: The oil-based ink is composed of (A) a dispersion-stabilizing resin, which is obtained using a macromonomer of a weight average molecular weight of 1×10^3 to 2×10^4 having a polymerizable double bond group represented by formula I and which has a repeating unit represented by formula II as a component, and (B) a monofunctional monomer, which is soluble in a non-aqueous solvent and become insoluble with the increasing polymerization degree, such as acrylic acid. This ink is prepared by dispersing copolymer particles obtained by polymerizing component B in the presence of component A, into a non-aqueous carrier liquid having an electric resistance of $10^9 \Omega \cdot \text{cm}$ or more and a permittivity of 3.5 or less, together with a colorant. In formula I, X_0 is $-\text{COO}-$, $-\text{CO}-$ and the like; and a_1 and a_2 are each H, a halogen and the like. In formula II, $X_1 = X_0$; Q_1 is a 6-32C aliphatic group; and b_1 , $b_2 = a_1$, a_2 .
